# CSE-101: Discrete Mathematics Chapter 10: Graphs 

Lec Md Jakaria
Dept of CSE, MIST

## Simple Graph

Definition 1. A simple graph $G=(V, E)$ consists of $V$, a nonempty set of vertices, and $E$, a set of unordered pairs of distinct elements of $V$ called edges.

## A simple graph

Los Angeles

How many vertices? How many edges?

## A simple graph

## SET OF VERTICES

V = \{ Chicago, Denver, Detroit, Los Angeles, New York, San Francisco, Washington \}

## SET OF EDGES

$\mathrm{E}=\{$ \{San Francisco, Los Angeles\}, \{San Francisco, Denver\}, \{Los Angeles, Denver\}, \{Denver, Chicago\}, \{Chicago, Detroit\}, \{Detroit, New York\}, \{New York, Washington\}, \{Chicago, Washington\}, \{Chicago, New York\} \}

## A simple graph

Los Angeles
The network is made up of computers and telephone lines between computers. There is at most 1 telephone line between 2 computers in the network. Each line operates in both directions. No computer has a telephone line to itself.

These are undirected edges, each of which connects two distinct vertices, and no two edges connect the same pair of vertices.

## A Non-Simple Graph

Definition 2. In a multigraph $G=(V, E)$ two or more edges may connect the same pair of vertices.

## A Multigraph

## THERE CAN BE MULTIPLE TELEPHONE LINES BETWEEN TWO COMPUTERS IN THE NETWORK.

Los Angeles

## Multiple Edges

Two edges are called multiple or parallel edges if they connect the same two distinct vertices.

## Another Non-Simple Graph

Definition 3. In a pseudograph $G=(V, E)$ two or more edges may connect the same pair of vertices, and in addition, an edge may connect a vertex to itself.

## A Pseudograph

THERE CAN BE TELEPHONE LINES IN THE NETWORK FROM A COMPUTER TO ITSELF (for diagnostic use).

## Loops

An edge is called a loop
if it connects a vertex to itself.

## Undirected Graphs

## A Directed Graph

Definition 4. In a directed graph $G=(V, E)$ the edges are ordered pairs of (not necessarily distinct) vertices.

## A Directed Graph

SOME TELEPHONE LINES IN THE NETWORK MAY OPERATE IN ONLY ONE DIRECTION .
Those that operate in two directions are represented by pairs of edges in opposite directions.

## A Directed Multigraph

Definition 5. In a directed multigraph $G=(V, E)$ the edges are ordered pairs of (not necessarily distinct) vertices, and in addition there may be multiple edges.

## A Directed Multigraph

## THERE MAY BE SEVERAL ONE-WAY LINES

IN THE SAME DIRECTION FROM ONE COMPUTER
TO ANOTHER IN THE NETWORK.

## Types of Graphs

| TYPE | EDGES | MULTIPLE EDGES <br> ALLOWED? | LOOPS <br> ALLOWED? |
| :--- | :--- | :--- | :--- |
| Simple graph | Undirected | NO | NO |
| Multigraph | Undirected | YES | NO |
| Pseudograph | Undirected | YES | YES |
| Directed graph | Directed | NO | YES |
| Directed multigraph | Directed | YES | YES |

## Adjacent Vertices (Neighbors)

Definition 1. Two vertices, $u$ and $v$ in an undirected graph G are called adjacent (or neighbors) in G, if $\{u, v\}$ is an edge of $G$.

An edge $e$ connecting $u$ and $v$ is called incident with vertices $u$ and $v$, or is said to connect $u$ and $v$. The vertices $u$ and $v$ are called endpoints of edge $\{u, v\}$.

## Degree of a vertex

Definition 1. The degree of a vertex in an undirected graph is the number of edges incident with it, except that a loop at a vertex contributes twice to the degree of that vertex.

$$
\operatorname{deg}(d)=1
$$

## Degree of a vertex

Definition 1. The degree of a vertex in an undirected graph is the number of edges incident with it, except that a loop at a vertex contributes twice to the degree of that vertex.

## Degree of a vertex

Definition 1. The degree of a vertex in an undirected graph is the number of edges incident with it, except that a loop at a vertex contributes twice to the degree of that vertex.
$\operatorname{deg}(b)=6$

## Degree of a vertex

Find the degree of all the other vertices. $\operatorname{deg}(a) \quad \operatorname{deg}(c) \quad \operatorname{deg}(f) \quad \operatorname{deg}(g)$

$\operatorname{deg}(d)=1$
$\operatorname{deg}(e)=0$

## Degree of a vertex

Find the degree of all the other vertices. $\operatorname{deg}(a)=2 \operatorname{deg}(c)=4 \operatorname{deg}(f)=3 \quad \operatorname{deg}(g)=4$
$\operatorname{deg}(b)=6$

$\operatorname{deg}(d)=1$
$\operatorname{deg}(e)=0$

## Degree of a vertex

Find the degree of all the other vertices.
$\operatorname{deg}(a)=2 \operatorname{deg}(c)=4 \quad \operatorname{deg}(f)=3 \quad \operatorname{deg}(g)=4$
TOTAL of degrees $=2+4+3+4+6+1+0=20$
$\operatorname{deg}(b)=6$

$\operatorname{deg}(d)=1$
$\operatorname{deg}(e)=0$

## Degree of a vertex

Find the degree of all the other vertices. $\operatorname{deg}(a)=2 \operatorname{deg}(c)=4 \quad \operatorname{deg}(f)=3 \quad \operatorname{deg}(g)=4$

TOTAL of degrees $=\mathbf{2 + 4 + 3 + 4 + 6 + 1 + 0 = 2 0}$ TOTAL NUMBER OF EDGES = 10 $\operatorname{deg}(b)=6$

$\operatorname{deg}(d)=1$
$\operatorname{deg}(e)=0$

## Handshaking Theorem

Theorem 1. Let $G=(V, E)$ be an undirected graph $G$ with e edges. Then

$$
\sum_{v \in v} \operatorname{deg}(v)=2 e
$$

"The sum of the degrees over all the vertices equals twice the number of edges."

NOTE: This applies even if multiple edges and loops are present.

## Subgraph

Definition 6. A subgraph of a graph $G=(V, E)$ is a graph $\mathrm{H}=(W, F)$ where $W \subseteq V$ and $F \subseteq E$.

## $\mathrm{C}_{5}$ is a subgraph of $\mathrm{K}_{5}$

$\mathrm{C}_{5}$

## Union

Definition 7. The union of 2 simple graphs $G_{1}=\left(V_{1}, E_{1}\right)$ and $G_{2}=\left(V_{2}, E_{2}\right)$ is the simple graph with vertex set $V=V_{1} \cup V_{2}$ and edge set $E=E_{1} \cup E_{2}$. The union is denoted by $G_{1} \cup G_{2}$.

## $W_{5}$ is the union of $S_{5}$ and $C_{5}$

## Homework

p. 443 \# 1 a, 2 a.
p. 454 \# 1-5, 12 adef, 19 abce, 44.

## Adjacency Matrix

A simple graph $G=(V, E)$ with $n$ vertices can be represented by its adjacency matrix, A, where entry $a_{i j}$ in row $i$ and column $j$ is

$$
a_{i j}= \begin{cases}1 & \text { if }\left\{v_{i}, v_{j}\right\} \text { is an edge in } G \\ 0 & \text { otherwise }\end{cases}
$$

## Finding the adjacency matrix

This graph has 6 vertices<br>a, b, c, d, e, f. We can arrange them in that order.

$W_{5}$

## Finding the adjacency matrix

There are edges from $\mathbf{a}$ to $\mathbf{b}$, from $\mathbf{a}$ to e , and from $\mathbf{a}$ to f

## Finding the adjacency matrix

There are edges from $b$ to $a$, from $b$ to $c$, and from $b$ to $f$

## Finding the adjacency matrix

There are edges from $\mathbf{c}$ to $\mathbf{b}$, from $\mathbf{c}$ to $\mathbf{d}$, and from $\mathbf{c}$ to f

## Finding the adjacency matrix

COMPLETE THE ADJACENCY MATRIX . . .

## Finding the adjacency matrix

Notice that this matrix is symmetric. That is $\mathbf{a}_{i j}=\mathbf{a}_{j i}$ Why?

## Path of Length $\mathbf{n}$

Definition 1. A path of length $n$ from $u$ to $v$ in an undirected graph is a sequence of edges
$e_{1}, e_{2}, \ldots, e_{n}$ of the graph such that edge $e_{1}$ has endpoints $x_{0}$ and $x_{1}$, edge $e_{2}$ has endpoints $x_{1}$ and $x_{2}$,
and edge $e_{n}$ has endpoints $x_{n-1}$ and $x_{n}$,
where $\mathrm{x}_{0}=u$ and $\mathrm{x}_{\mathrm{n}}=v$.

## One path from a to e

This path passes through vertices $f$ and $d$ in that order.
$W_{5}$

## One path from a to a

$W_{5}$

This path passes through vertices $f, d, e$, in that order. It has length 4.

It is a circuit because it begins and ends at the same vertex.

It is called simple because it does not contain the same edge more than once.

## Path of Length n

Definition 3. An undirected graph is called connected if there is a path between every pair of distinct vertices of the graph.

IS THIS GRAPH CONNECTED?

$W_{5}$

## Theorem 1

Theorem 1. There is a simple path between every pair of distinct vertices of a connected undirected graph.

## Paths of Length $r$ between Vertices

Theorem 2. Let $G$ be a graph with adjacency matrix A with respect to the ordering
$v_{1}, v_{2}, \ldots, v_{n}$. The number of different paths of length $r$ from $v_{i}$ to $v_{j}$, where $r$ is a postive integer, equals the entry in row $i$ and column $j$ of $A^{r}$.

NOTE: This applies with directed or undirected edges, with multiple edges and loops allowed.

## Homework

p. 463 \# 1, 5, 9 adef, 11, 13, 15, 17.
p. 473 \# 1, 5, 10 abc (use adjacency matrix $A^{r}$ ), 23, 37.

## Thank You
